

## Lesson 4: What Fraction of a Group?

Let's think about dividing things into groups when we can't even make one whole group.

### 4.1: Estimating a Fraction of a Number

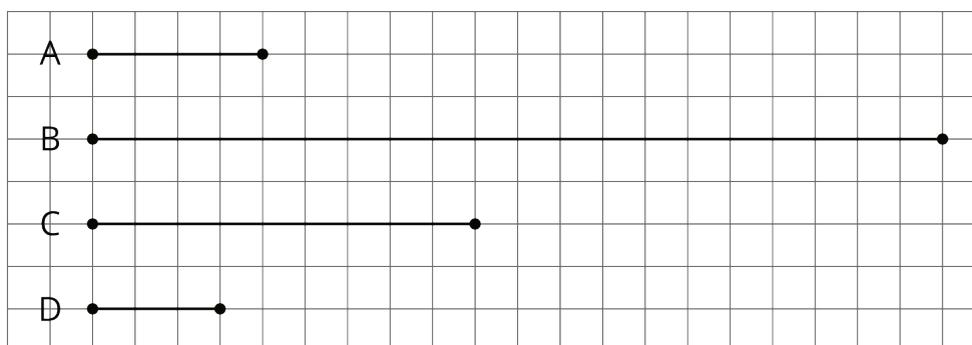

1. Estimate the quantities:

- What is  $\frac{1}{3}$  of 7?
- What is  $\frac{4}{5}$  of  $9\frac{2}{3}$ ?
- What is  $2\frac{4}{7}$  of  $10\frac{1}{9}$ ?

2. Write a multiplication expression for each of the previous questions.

### 4.2: Fractions of Ropes

Here is a diagram that shows four ropes of different lengths.

1. Complete each sentence comparing the lengths of the ropes. Then, use the measurements shown on the grid to write a multiplication equation and a division equation for each comparison.

- Rope B is \_\_\_\_\_ times as long as Rope A.
- Rope C is \_\_\_\_\_ times as long as Rope A.
- Rope D is \_\_\_\_\_ times as long as Rope A.

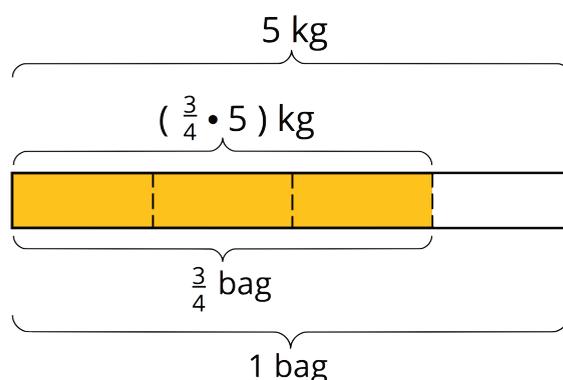

### Lesson 4 Summary

It is natural to think about groups when we have more than one group, but we can also have a *fraction of a group*.

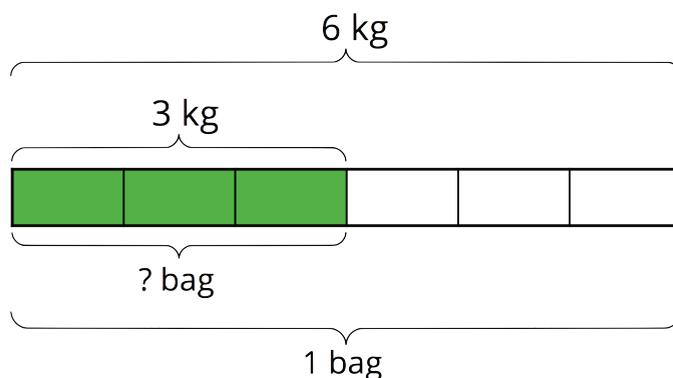

To find the amount in a fraction of a group, we can multiply the fraction by the amount in the whole group. If a bag of rice weighs 5 kg,  $\frac{3}{4}$  of a bag would weigh  $(\frac{3}{4} \cdot 5)$  kg.

Sometimes we need to find what fraction of a group an amount is. Suppose a full bag of flour weighs 6 kg. A chef used 3 kg of flour. What fraction of a full bag was used? In other words, what fraction of 6 kg is 3 kg?

This question can be represented by a multiplication equation and a division equation, as well as by a diagram.

$$\begin{aligned} ? \cdot 6 &= 3 \\ 3 \div 6 &= ? \end{aligned}$$

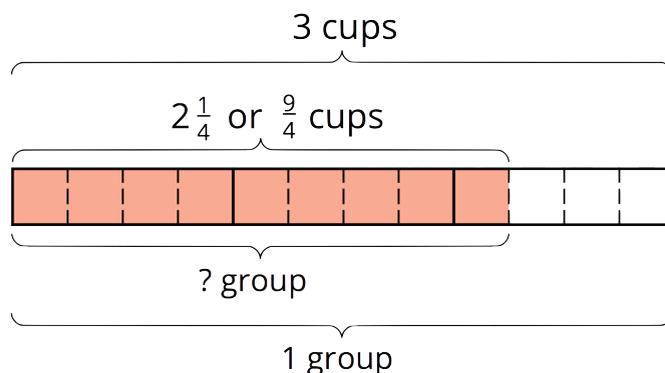

We can see from the diagram that 3 is  $\frac{1}{2}$  of 6, and we can check this answer by multiplying:  
 $\frac{1}{2} \cdot 6 = 3$ .

In *any* situation where we want to know what fraction one number is of another number, we can write a division equation to help us find the answer.

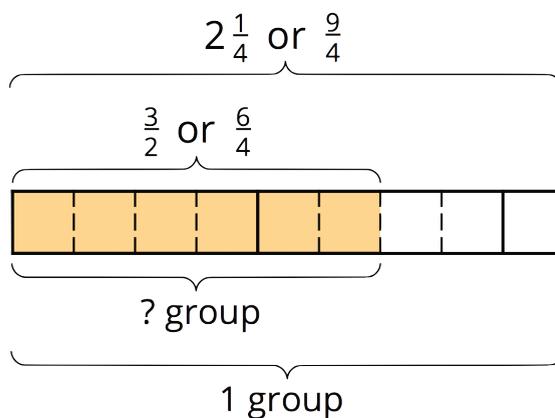

For example, “What fraction of 3 is  $2\frac{1}{4}$ ?” can be expressed as  $? \cdot 3 = 2\frac{1}{4}$ , which can also be written as  $2\frac{1}{4} \div 3 = ?$ .

The answer to “What is  $2\frac{1}{4} \div 3$ ?” is also the answer to the original question.

The diagram shows that 3 wholes contain 12 fourths, and  $2\frac{1}{4}$  contains 9 fourths, so the answer to this question is  $\frac{9}{12}$ , which is equivalent to  $\frac{3}{4}$ .

We can use diagrams to help us solve other division problems that require finding a fraction of a group. For example, here is a diagram to help us answer the question: “What fraction of  $\frac{9}{4}$  is  $\frac{3}{2}$ ?” which can be written as  $\frac{3}{2} \div \frac{9}{4} = ?$ .

We can see that the quotient is  $\frac{6}{9}$ , which is equivalent to  $\frac{2}{3}$ . To check this, let's multiply.

$$\frac{2}{3} \cdot \frac{9}{4} = \frac{18}{12}, \text{ and } \frac{18}{12} \text{ is, indeed, equal to } \frac{3}{2}.$$
